PRIVACY AND FUNGIBILITY FOR ALL

Monero is a tool that people can actually use. It makes receiving payments hassle-free, since merchants and individuals no longer need to fear the source of funds they are accepting.

Furthermore, merchants do not want all their vendors known, and individually do not want everyone to know how much they are spending.

Monero is different because every transaction is always private. There is no way for pools and exchanges to opt out of sending private transactions. Thus, Monero's anonymity set far exceeds any other coin's anonymity set. There is no suspicion in using a private transaction, since all transactions are private. A single transaction does not stick out. This privacy is afforded with the best technology and community.

We encourage you to take a few minutes to learn about Monero in this pamphlet.

What is fungibility?

In economics, fungibility is the property of a good or a commodity whose individual units are essentially interchangeable.
